

Network Installation of Cadra

When using the Network Installation you need a PC that has full Cadra installed, you will need to install Cadra using either a custom or Express Installation on the PC that you will be using as the networked PC.

Then you can use the Network Installation on all of the other PC's that are going to run the Network version of Cadra.

There are a couple of things to keep in mind when using the Network installation.

- You must have a mapped drive to the full install version on all PC's that the Network install will be done.
- Cadra installs only a few files on the local PC; all other files/executables are on the mapped drive.
