

Enhanced Short Key for Finding Arc Centers

A customer recently called our HelpDesk asking if it was possible to change the behavior of the 'm' short key.

By default, the 'm' short key adds a point to the current line at the center of the arc or circle nearest the cursor.

The additional functionality was to have the short key add the point and report the dimensions of the arc/circle in the scroll area.

To implement this functionality, add the following line to your expcad.cfg file (.cimcad file on UNIX):

```
short m (arc.center;wharc)
```
